

# Assistive Robotics and their Uses During the Pandemic

Southwestern Oklahoma State University

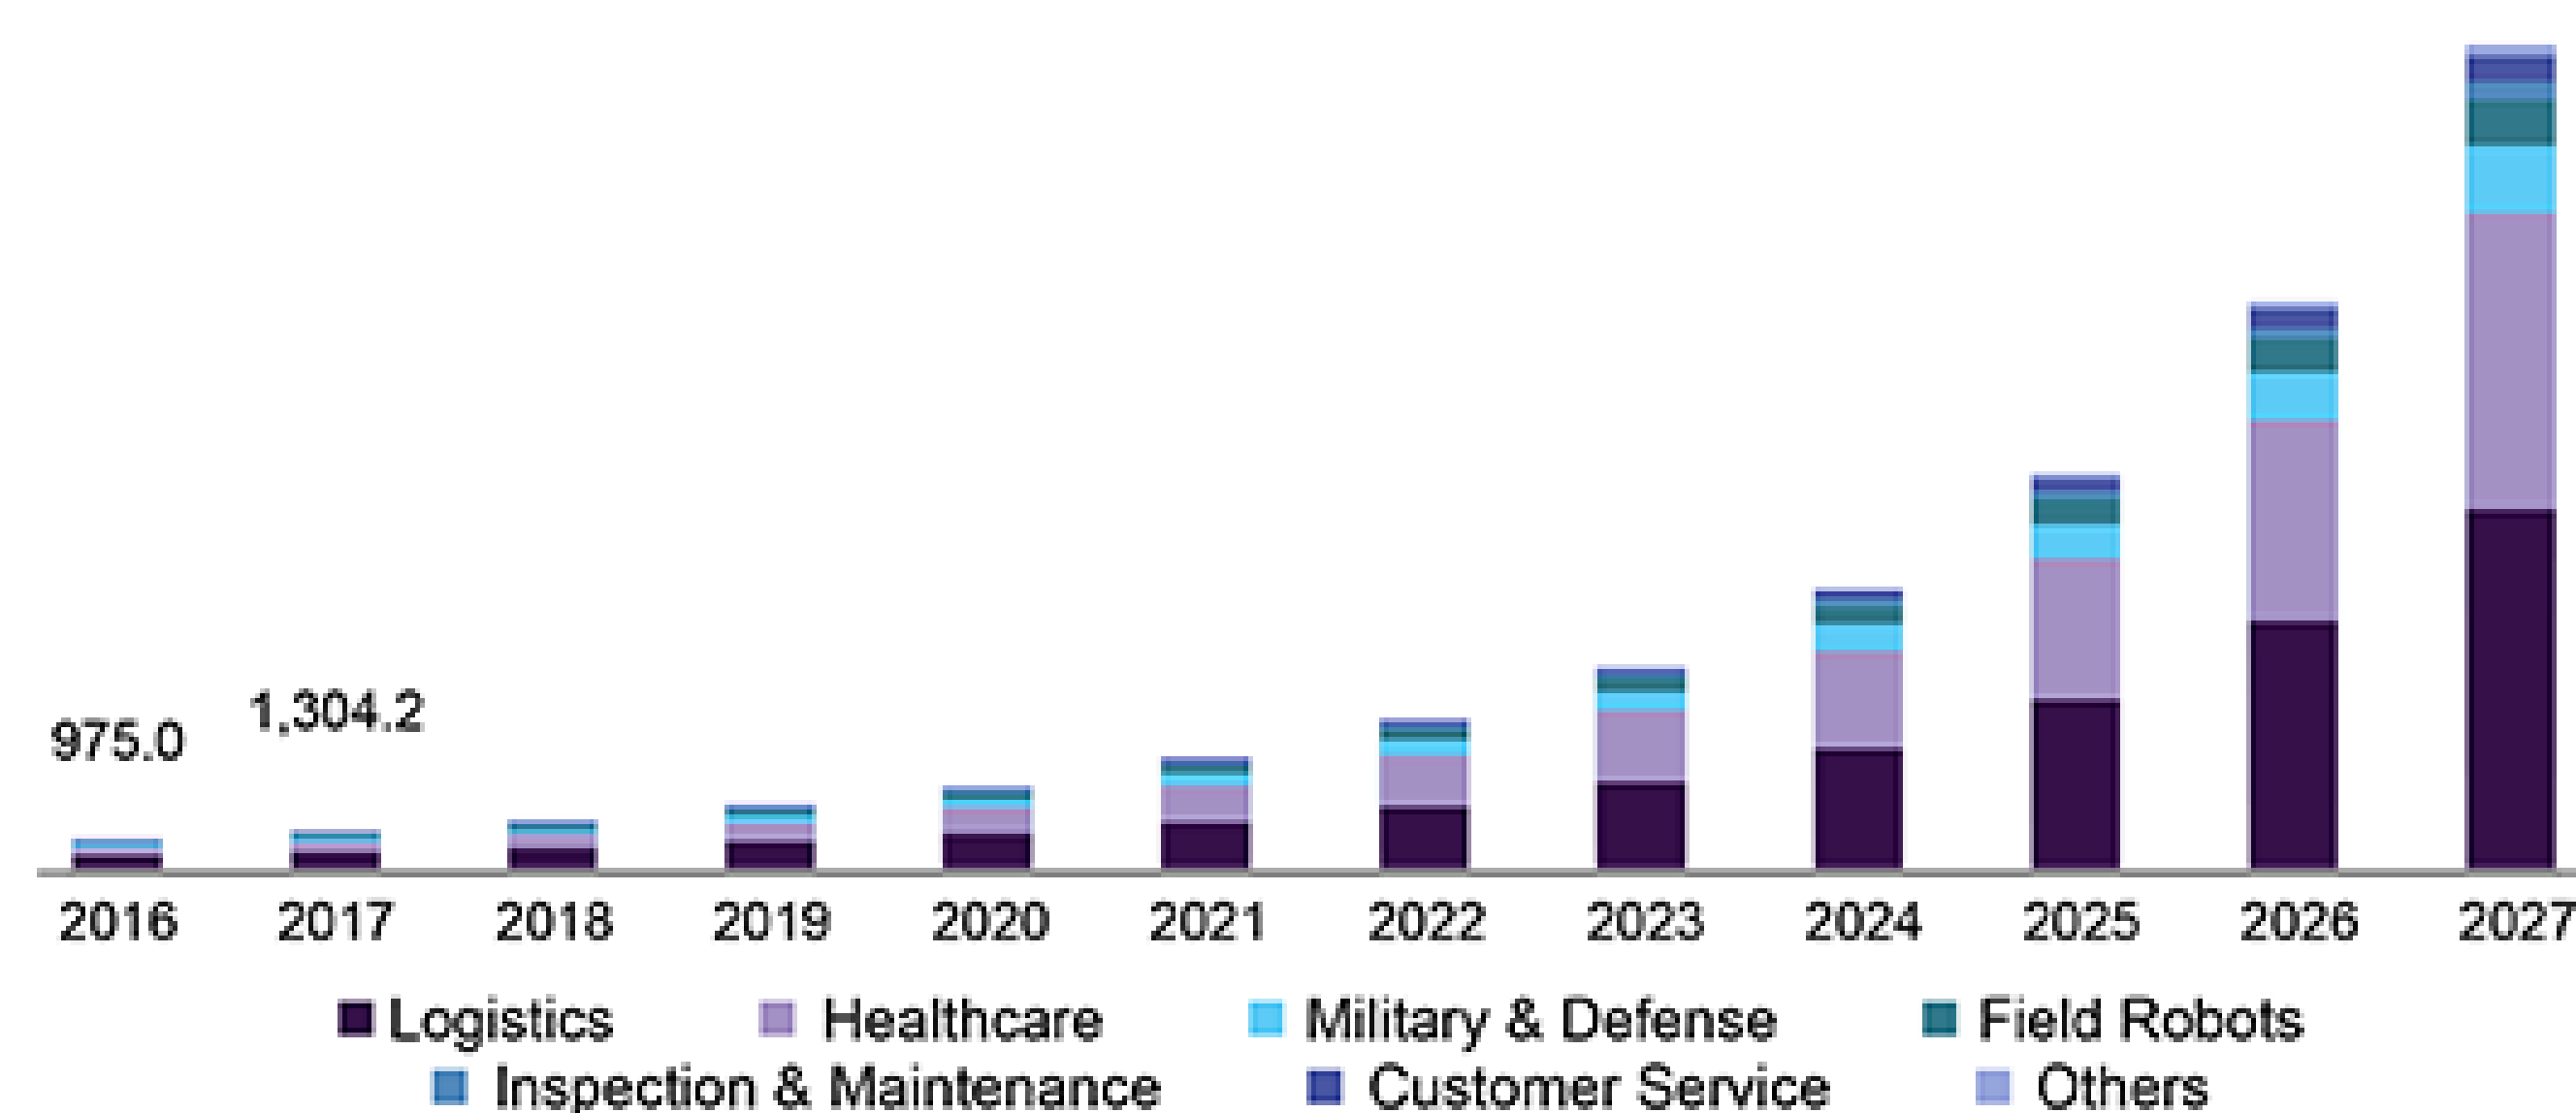

Thomas Klassen | Dr. Jeremy Evert | Department of Computer Science and Engineering Technology

## Abstract

- “Assistive Robotics” defines any device that can sense, process sensory information, and perform actions that benefit people with disabilities
- This form of technology can be used on a much higher scale with a greater number of uses
- We have an opportunity to expand the usage of assistive robotics to help combat COVID-19

## Growth of Robotics Market

U.S. professional service robots market size, by application, 2016 - 2027 (USD Million)

## Social Isolation and Mental Health

- Due to social isolation, thousands of people are suffering from loneliness and several mental health issues
- Social robots can fill the gap by providing physical and social interactions while also having the ability to assist in daily tasks.

## Combating COVID-19

- There are numerous ways that robotics can help combat or contain the COVID-19 virus including:
- Disinfection robots that use ultraviolet light for disinfection
- Mobile robots that can move freely while monitoring the body temperature of several people at a time
- Implementing a robotic nose swab for COVID Testing

## Current Research Project

- I am currently working with an iRobot Create2 in an attempt to make an autonomous robot that can carry out several functions
- Starting with navigation, the robot will be able to move autonomously while avoiding obstacles
- I plan on using the attached camera to recognize and monitor the distance between individuals to improve social distancing
- Lastly, programming the robot with facial recognition software and contact tracing to recognize those with COVID symptoms and alert others in the area
